My application layer model represents an interactive online learning system designed to support both teachers and students. The system begins with the Login and Authentication module, which connects to the database to ensure secure access for all users. Teachers use the Content Management System (CMS) to upload, edit, and organize learning materials stored in the cloud. Students interact mainly with the Quiz and Activity module, which allows them to answer questions, join activities, and receive immediate feedback. To support collaborative learning, I included a Real-Time Interaction service, enabling live participation during lessons similar to platforms like Kahoot. The model also integrates an Analytics Dashboard, which retrieves data from the result tracking service and summarizes student performance for teachers. A security layer ensures that user information and learning content are protected throughout the process. Overall, this application layer model shows how different modules are connected to provide a reliable, organized, and engaging educational experience.
